

Installing XLSTAT on Windows

To install XLSTAT, you should use an account that has administrator rights on the machine. If there are several accounts on the machine, the administrator should install XLSTAT using the **Custom** option and run XLSTAT once from his account to enter the license key.

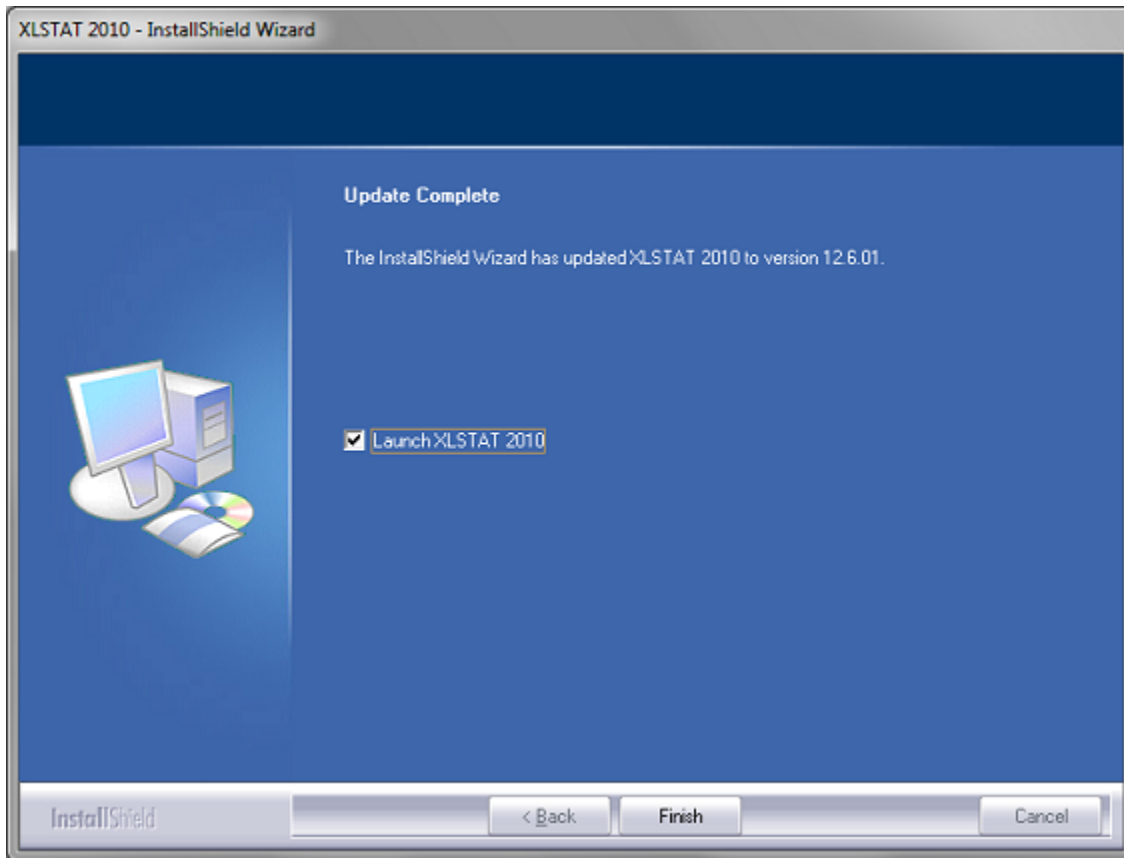

After having downloaded one of the XLSTAT files on our website page download, you need to execute the file **xlstat2010.exe**

Double click on the file and decide to execute it.

Allow XLSTAT to modify the settings on your computer.

Once this is done, the **InstallShield Wizard** will start. Follow the instructions until the installation is finished. You can decide to launch XLSTAT right away by ticking the option **Launch XLSTAT 2010**.

You can then run XLSTAT for the first time and set up the license key. More information on how to operate this task may be found in the following [tutorial](#).
